

## **June 7, 2015 Daily Report**

### ***(Presenting June 6 Progress and Plans Forward)***

#### **Refugio Incident**

This daily report addresses elements listed in the *Order for Removal, Mitigation or Prevention of a Substantial Threat of Oil Discharge*. The elements include descriptions of 1) anticipated problems and planned resolutions, 2) significant developments, 3) work performed, 4) treatment and disposal information, 5) analytical data received, and 6) schedule of work. The following attachments contain detailed information pertaining to each listed element:

- **Summary of Anticipated Problems and Resolutions** (June 7)
  - Anticipated problems and planned resolutions
- **Executive Summary** (describing prior day, June 6)
  - Significant Developments
  - Work Performed
  - Disposal Information
- **Incident Status Summary Form 209** (Effective June 6 07:00 – June 7 06:59)
- **CTEH Summary of Environmental Sampling Efforts** (June 6)
  - Analytical Data Received to Date
- **Incident Action Plan** (Effective June 7 06:00 – June 9 05:59)
  - Schedule of Work to be Performed (Form 204)

## Summary of Anticipated Problems and Resolutions

### Refugio Incident

June 7, 2015

Anticipated Problems	Planned Resolutions
<input type="checkbox"/> Cultural considerations.	<input type="checkbox"/> Continue to work with cultural monitoring specialist to ensure we have resources available to monitor all response activities in cultural sensitive areas. Agreement reached between cultural rep. and UC regarding excavation activities in the Sec. 4. We will continue to coordinate as needed.
<input type="checkbox"/> Safety related issues referring to highway traffic on 101 near Refugio Staging and Section 1 entrance and exit.	<input type="checkbox"/> Signage has been placed near lane closures, crews have been instructed regarding access, crews will continue to monitor the need for additional signage and/or personnel to provide safe access.
<input type="checkbox"/> Workers in Section 4 (within the hot zone) are required have proof of respirator fit test. On June 5 one of the workers was not able enter the area because his fit test certification was not available on hand. Worker was certified, just no proof on site.	<input type="checkbox"/> Communicate to all incoming personnel that all required certifications will be needed prior to entering portions of the site.

Incident Command Post Santa Barbara  
Refugio Oil Spill  
*Unified In All Missions*  
Status as of:  
06 Jun 2015 / 2000 PDT / Response Day 19  
[www.refugioresponse.com](http://www.refugioresponse.com)

### Executive Summary

The ICP is currently overseeing operations in Santa Barbara and Ventura County, 96.5 miles of shoreline, 30 miles of offshore and inland where the response originated. Plains All American estimates that the maximum potential release is 101,000 gallons spilled.

Samples have been collected at all tar ball sites and will be fingerprinted to determine if there is any correlation to the Refugio Beach Incident.

Shoreline Cleanup Assessment Technique teams, made up of scientists trained in evaluating oil coverage on shorelines, survey beaches and report on their status. The survey results drive where cleanup operations will occur. Survey work includes looking at the high and low tide areas, examining the area below the sand, down to two feet, and checking all of the rock and other beach structures for oiling. For the Southern California area, natural seeps are part of the natural state of the environment. Once the beaches are signed off they will return to their natural state that includes the presence of tar and oil from natural seeps.

SCAT Phase II end points have been achieved for 44% of the impacted shoreline. The attached graphic depicts detailed data about this progress.

The following supporting plans have been approved by the Unified Command:

- Release Area Stormwater/Erosion Control Plan (SW/ECP)
- Fingerprinting Sampling and Analysis Plan Version 1.1
- Air Sampling and Analysis Plan
- Emergency Response Sampling and Analysis Workplan Version 1.1
- Seep Oil Sheen Sampling Plan

### Current Impacts

- The majority of oiling is located on beaches, cobble, riprap, and on rock faces between Arroyo Hondo and El Capitan Beach. Light oiling has been discovered as far as Point Mugu (east) and 2 miles west of Arroyo Hondo (west). These areas have been targeted for manual removal as needed.

### Potential Impacts

- As free-floating oil progressed east, Coal Oil Point, Haskell Beach, Bacara Resort, and Goleta Beach were oiled, however it has yet to be verified whether light oiling is from natural seepage or the current discharge. Coal Oil Point is a sensitive habitat for Plovers; Goleta Beach is a popular swimming and water sports location.

## Response Efforts

- Onshore:
  - Work continued on the bluff. Lane closures are expected to continue daily from 0900 to 1500.
- Shoreline:
  - Work crews continue clean up at work sites from Gaviota Creek, Santa Barbara County, to Hollywood Beach, Ventura County.
  - 1,080 feet of hard and sorbent boom remain in place, protecting 3 sensitive sites as identified in the ACP.
  - The State Park has closed Refugio and El Capitan state beach through 25 June.
- On Water:
  - The assigned 17 vessels conducted on-water operations only. No oily water mixture was collected today, therefore the cumulative total remains 14,267 gallons.
  - Oil was observed from scheduled NOAA over-flights. This area is prone to natural oil seepage and the environmental unit is assessing possible sources and distinction of natural seepage versus oil spilled from this response.
  - The temporary safety zone remains in place for 6 NM of shoreline from Tajiguas creek to and including El Capitan Beach, extending out 500 yards from the shoreline. In addition, a 100 yard radius temporary safety zone remains in place around all vessels engaged in the recovery operations.
  - A 23 mile by 6 mile area offshore has been closed to fishing. CA Fish and Wildlife P/B Swordfish remains on scene to enforce fishery closure.
  - A 1000 foot temporary flight restriction within a 5 mile radius of Refugio Beach has been extended to 20 Jun 2015. An internal incident flight restriction remains in effect within ½ mile or an altitude of 500ft in the vicinity of Coal Oil Point to protect Snowy Plover habitat.

## Impact Measurements

	TOTAL Birds			TOTAL Mammals		
Date	Live	Dead	Date Totals	Live	Dead	Date Totals
6 Jun 2015	2	13	15	1	5	6

Oiled Soil	0	3,840
Culvert Soil	0	70
Absorbent	45	165

#### External Affairs

- Helicopter overflights are being planned for 2 media outlets (CNN and a local station) with a seep expert.
- Produced and distributed 20+ products with the overarching theme of “progress,” including photos of current operations and updated fact sheets.

#### Tribal and Elected Officials

- Chumash Tribal Members continue to provide cultural and archeological guidance and oversight as needed. 54 cultural monitors and 10 archeologists are supporting the response.
- **Personnel Involved**
- 1,147 (down from 1,287) workers are engaged in Field Operations.
- 119 (down from 124) personnel are assigned to the ICP.
- Total personnel 1,266 (down from 1,411)

**4. Situation Summary as of Time of Report:**  
 Response Day #19, IAP #13  
 SCAT Phase II end points have been achieved for 44% of the impacted shoreline.  
 SCAT Teams have assessed approximately 79.71 miles of shoreline. Of that, 3.97 miles was heavily impacted, 18.23 miles was moderately impacted, 24.13 miles was lightly impacted, 4.68 miles was very lightly impacted, 21.68 miles was reported with tar balls, and 7.02 miles was identified with no impact. The total miles of impacted shoreline is 72.69 miles.  
 The 17 assigned vessels conducted snare ops only. No oily water mixture was collected, therefore the cumulative total remains 14,267 gallons. There are 1,147 personnel conducting field operations, and 119 personnel in the ICP. The following cumulative totals have been reported removed by waste management; 660 cubic yards of oiled sand, 660 cubic yards of oiled vegetation, 300 cubic yards of oiled debris/ PPE, 3,840 cubic yards of oiled soil, 70 cubic yards of culvert soil, and 165 cubic yards of absorbent material. An estimated 600 bbls of product was pumped from the pipeline. 3 sensitive sites identified in the ACP continue to have boom deployed. Currently, 540 ft of hard boom, and 540 ft of sorbent boom are being used to protect these ACP sites; totaling 1,080 feet.  
 Wildlife reports (to date) 60 fowl captured, 149 fowl dead, 44 mammals captured, and 72 mammals dead.

**5. Future Outlook/Goals/Needs/Issues:**  
 -Ensure the safety of response personnel and the public  
 -Continue to evaluate the oil impacts  
 -Evaluate SCAT  
 -Continue to prevent migration of oil from release site to shoreline  
 -Continue to recover discharged oil from impacted areas both public and private, and manage waste according to plan  
 -ID and protect environmentally sensitive areas  
 -ID and protect culturally sensitive areas including wildlife  
 -Keep public and stakeholders informed  
 -Minimize economic impacts  
 -Repair pipeline safely  
 -Provide recovery and care of oiled wildlife.  
 -Differentiate seep oil from incident oil

## Refugio Incident

### Summary of CTEH<sup>®</sup> Environmental Sampling Efforts

#### June 6, 2015

As part of response efforts, CTEH<sup>®</sup> began collecting product and environmental samples, i.e., water and/or sediment, on May 20, 2015. This environmental sampling has been conducted under a Unified Command-approved sampling plan. This report contains environmental sampling efforts completed to date by CTEH<sup>®</sup> in support of Refugio Incident response efforts. **Table 1**, below, provides a sample count for each type of environmental media collected by CTEH<sup>®</sup>. **Table 2** provides a summary of TPH<sup>1</sup> data reported in water samples to date. Maps of environmental sampling locations are provided as attachments.

**Table 1: Environmental Preliminary Sample Summary**  
**05/20/2015– 06/05/2015**

Media	Matrix	Sample Count
Water	Surface Water	133
	Water Column	51
	Culvert/Flush Water	2
Sediment	Beach Sediment <sup>2</sup>	18
	Ocean Sediment <sup>3</sup>	14
Soil	Backfill Soil	6
	Trench Excavation Soil	9
	Background Soil	11
Petroleum	Product/Tar Ball Sample	33
	Sheen/Seep	14

<sup>2</sup> Beach sediment samples are collected from both the intertidal zone and on dry sand above the intertidal zone.

<sup>3</sup> Ocean sediment samples were collected at the same location as the water column samples.

**Table 2: TPH<sup>1</sup> Preliminary Data Summary<sup>4</sup>**  
**05/20/2015– 06/05/2015**

		Highest Detection		Most Recent TPH Result Received

<b>7. Work Assignments</b>					
<p>Wildlife Recon. Team - Collect real time data on animals at risk and staff the Wildlife Hotline.</p> <p>Wildlife Recovery Teams - Coordinate and supervise recovery of live and dead oiled wildlife in assigned divisions and in response to reports.</p> <p>Group Supervisors separate for Birds and Mammals, but field staff are shared between Bird and Mammal Strike Teams.</p> <p>Transport - Coordinate and supervise transport of collected animals between Recovery, Field Stabilization and Care.</p> <p>Field Stabilization - Provide first aid to live captured animals prior to transport to primary care centers.</p> <p>Care/Processing - Document oiling status , conduct intake examinations , necropsy dead animals, provide pre-wash care , clean oil from affected animals, return animals to normal function, and release in clean environment.</p>					
<b>8. Special Instructions</b>					
<p>Attend morning safety and planning briefing. Immediately report any injury to supervisor and complete an injury report form. *Personnel must have completed 24-hour HAZWOPER training and OWCN Wildlife Recovery Levels 1 and 2, at minimum.</p> <p>Instructions for Dead Wildlife and Natural Resource Protection.</p> <p>Any LIVE oiled wildlife (birds, mammals, or sea turtles) observed or incidentally collected in clean up operations should be immediately called in to the Wildlife Hotline at 877-823-6926.</p> <p>Any DEAD oiled birds, mammals, or sea turtles observed as part of cleanup operations should be called in to the team's supervisor. Supervisors can instruct the team in separating the oiled animal from the regular waste stream and (ideally) collecting it in a separate plastic bag, labeled with division/assignment area, and called into the Wildlife Hotline at 877-823-6926 for Recovery personnel to arrange pick up.</p> <p>For all other DEAD oiled wildlife (marine organisms) discontinue segregating these - they will not be picked up. Dispose with the rest of the oiled material being removed.</p> <p>Do not initiate any on-shore response or cleanup at Coal Oil Point without consulting the USFWS and California Dept of Fish and Wildlife.</p>

All response personnel are to be cautious of moving vehicles at all times and look in all directions before proceeding. Response personnel should be aware that all railroad tracks are in active use and should show extreme caution when operating in vicinity of tracks.

- Leave cultural materials in place at the site of discovery, and mark its location.
- Stop clean-up work in the vicinity surrounding the site, within a 6ft radius.
- Immediately inform the field supervisor, who in turn, should immediately inform the FOSC and/or an appropriately designated cultural resource specialist. Obtain/provide location on map by indicating latitude/longitude.

Report All Injuries require a immediate notification to Direct Supervisor.

Animal carcasses that have orange flagging indicates that no further action is needed. These flagged animals have already been assessed and reported

WILDLIFE RECOVERY GROUP MINIMIZATION MEASURES					
<p><b>Habitat-specific Measures</b>  These measures are intended to minimize impacts to all biological resources within the habitat and should be implemented to the extent possible regardless of whether listed species are present.</p> <p><b>Marine</b></p> <ul style="list-style-type: none"> <li>• Avoid entering kelp beds as much as possible.</li> <li>• Avoid boat traffic traveling near or through flocks of seabirds resting in the water.</li> <li>• Have a wildlife monitor present on all boats.</li> <li>• No spill response activities should take place within 1,000 feet of nesting seabirds.</li> <li>• If a sea otter is observed, keep all response activities as far away from the animal(s) as possible until an expert can be consulted.</li> </ul> <p><b>Riparian</b></p> <ul style="list-style-type: none"> <li>• Avoid entering wetted areas as much as possible.</li> <li>• Avoid disturbing vegetation as much as possible.</li> <li>• The number of access routes, size of staging areas, and the total area of the response should be limited to the minimum necessary to achieve the mission.</li> <li>• During the typical breeding season for riparian birds (March 1 – September 15), a biologist should survey riparian vegetation to identify, flag and avoid nests as much as possible.</li> <li>• Vegetation should be hand trimmed to remove affected portions as necessary; roots should be left in place.</li> <li>• Response activities should avoid or minimize changes in channel morphology</li> <li>• No heavy equipment (bobcats, back hoes, etc.) or earth moving in, or next to the creek shall be used without prior DFW approval.</li> <li>• Any listed plant species should be flagged and avoided.</li> <li>• For areas potentially occupied by California red-legged frogs, least Bell's vireos, southwestern willow flycatchers, see species-specific minimization measures.</li> </ul> <p><b>Sandy Beach/Dune</b></p> <ul style="list-style-type: none"> <li>• Avoid entering vegetated dune habitat as much as possible.</li> <li>• If vehicle traffic is required in the beach, travel should be restricted to the wet sand as much as possible and should avoid driving over wrack.</li> <li>• Vehicle traffic should be operated at slow enough speeds to avoid/minimize impacts to wildlife (approximately 5 to 10 miles per hour).</li> <li>• Use pre-existing access routes through dune habitat; if new access routes are necessary a biologist should be consulted on their location.</li> <li>• Manual oil removal techniques should be used as much as possible.</li> <li>• All trash or anything that would attract wildlife to the work area should be removed on a daily basis.</li> <li>• Dead oiled wildlife should be removed or buried to minimize the secondary oiling of scavenging species.</li> <li>• For areas potentially occupied by western snowy plovers and/or California least terns, see species-specific minimization measures.</li> </ul> <p><b>Estuarine</b></p> <ul style="list-style-type: none"> <li>• Avoid entering wetted habitat as much as possible.</li> <li>• Avoid disturbing vegetation as much as possible.</li> <li>• Utilize existing access routes; if new access routes are necessary a biologist should be consulted on their location.</li> <li>• A biologist should be present throughout the duration of the cleanup activities.</li> <li>• Any listed plant species should be flagged and avoided.</li> <li>• A biologist should look for nests and establish suitable buffer areas to prevent impacts</li> <li>• For areas potentially occupied by tidewater gobies or light-footed clapper rails, see species-specific minimization measures.</li> </ul> <p><b>Coastal Bluff</b></p> <ul style="list-style-type: none"> <li>• Utilize existing access routes; if new access routes are necessary a biologist should be consulted on their location.</li> <li>• Previously-disturbed areas should be used for equipment staging and vehicle parking to the maximum extent practical.</li> <li>• Any listed plant species should be flagged and avoided.</li> </ul> <p><b>Species-specific Measures</b>  These measures are specifically targeted to minimize impacts to listed species during initial response, USFWS should be contacted immediately to provide incident-specific measures to best protect these species.</p> <p><b>Tidewater goby</b></p> <ul style="list-style-type: none"> <li>• Equipment and foot traffic entering wetted areas should be avoided to the maximum extent practical to prevent crushing tidewater gobies, their burrows, and eggs.</li> <li>• If supplemental water is used to flush culverts recommend gradually increasing the intensity/volume during the flush, as tidewater gobies aren't strong swimmers and could be injured or killed if there were sudden high currents. As the flow is being gradually increased, a biologist should be monitoring the culvert exit for tidewater gobies.</li> </ul>					
<b>10. Prepared By</b> Mike Nosbaum	<b>Date/Time</b> 06/06/2015 17:00	<b>11. Reviewed By (PSC)</b> A. Holton	<b>Date / Time</b> 06/06/2015 17:00	<b>12. Reviewed By (OSC)</b> Ryan Crider	<b>Date / Time</b> 06/06/2015 17:00
ASSIGNMENT LIST		06/06/2015 13:27		ICS 204-CG (Rev.10/07)	

- Prior to initiation of any dewatering or diversions, a qualified biologist should install 1/8 inch block nets outside the impact areas to exclude tidewater gobies. If widely separated sites are involved, more than one set of block nets should be placed to protect the work area. The nets should be installed on the first day of work and monitored thereafter for the duration of the work.
- Once the block nets are secured, qualified biologist(s) should remove all tidewater gobies found between the block nets using a 1/8 inch seine and dip nets, and relocate tidewater gobies to suitable habitat downstream of the proposed project site.
- If activities requiring block nets cannot be completed in one day, a new set or successive sets of block nets should be deployed each day, and subsequent surveys and capture/relocation performed accordingly. Fish released from one day's work should not be released into areas projected to be excavated on successive days.
- Should dewatering occur, any pumps used should be fitted with an anti-entrapment device(s) to prevent tidewater gobies from being drawn into the pump or impinged on intake screening.
- Prior to initiation of activities within occupied habitat, an informal tailgate session should be performed in order to inform response personnel about the tidewater goby avoidance/ minimization measures to be implemented during the response.

#### Least Bell's vireos and/or southwestern willow flycatchers

- Disturbance of riparian vegetation should be avoided as much as possible.
- A qualified biologist should conduct surveys within suitable habitat for least Bell's vireos and southwestern willow flycatchers during the nesting season (March 1 – September 15) prior to disturbance of riparian vegetation to identify and establish exclusion buffers around any nests (generally at least 500 feet).
- Manual equipment should be used in occupied habitat as much as possible to minimize disturbance from noise.
- If vegetation removal is required, roots should be left in place as much as possible.
- A qualified biologist should be present as much as possible during activities that impact suitable habitat.

#### California least tern and/or Western snowy plover

- All responders should be informed of the potential for western snowy plovers and/or California least terns to be impacted and of the avoidance/minimization measures being implemented.
- A qualified biologist should identify areas that may contain nests or chicks, and any entry into these areas should be avoided.
- Any work required within nesting areas should be accompanied by a qualified biologist.
- A qualified biologist should identify and demarcate access and egress routes.
- The number of vehicles and number of vehicle trips should be reduced to the minimum needed to achieve the mission.
- All activities near nests or chicks should occur on the lower beach (wet sand), if possible.
- Watch for and avoid western snowy plovers sheltering in tire tracks and sandy depressions.
- If vehicles are used, speed should be kept to less than 10 mph, and vehicles should remain on the lower beach (wet sand), if possible. If it is not possible to remain on the lower beach (e.g., it is high tide), responders should stop every 100 m and scan ahead with binoculars to look for western snowy plovers and California least terns on the beach.
- The amount of wrack, shells, and natural debris removed from the beach should be minimized. If shoreline pre-cleaning is necessary, debris should be stockpiled in an appropriate location (avoiding nesting locations) and returned to the beach after the threat of oil is gone, to the extent practical.

#### California red-legged frog

- A qualified biologist should survey the work area prior to the onset of response activities to identify California red-legged frog egg masses, tadpoles, juveniles and adults.
- All egg masses should be avoided as much as possible and should only be relocated by a qualified biologist if oiling is imminent or response activities are sure to injure or kill the eggs.
- Tadpoles, juveniles and adults that could be injured or killed by exposure to oil or response activities should be relocated by a qualified biologist to a nearby suitable habitat that would not be impacted by response activities (ideally, upstream in the same drainage, or in the same watershed).
- After California red-legged frogs have been relocated outside of the work area, exclusion fencing (silt fence or similar) can be installed to minimize frogs from re-entering the work area. Fences should be inspected daily and should not be expected to completely prevent re-entry.
- After California red-legged frogs have been relocated outside of the work area, exclusion fencing (silt fence or similar) can be installed to minimize frogs from re-entering the work area. Fences should be inspected by a qualified biologist each morning and should not be expected to completely prevent re-entry.
- Open excavations and trenches should be covered each night to prevent entrapment of frogs.
- If vegetation removal is necessary, roots should remain in place as much as possible.

Any DEAD oiled birds, mammals, or sea turtles observed as part of cleanup operations should be called in to the team's supervisor. Supervisors can instruct the team in separating the oiled animal from the regular waste stream and (ideally) collecting it in a separate plastic bag, labeled with division/assignment area, and called into the Wildlife Hotline at 877-823-6926 for Recovery personnel to arrange pick up.

Do not initiate any on-shore response or cleanup at Coal Oil Point without consulting the USFWS and California Dept of Fish and Wildlife.

On Water: Avoid entering kelp beds as much as possible. Avoid boat traffic traveling near or through flocks of seabirds resting on water, stay 1000 ft away from nesting seabirds. If sea otter is observed keep clear and call Mike Harris immediately. 831-212-7090

All response personnel are to be cautious of moving vehicles at all times and look in all directions before proceeding. Response personnel should be aware that all railroad tracks are in active use and should show extreme caution when operating in vicinity of tracks.

All PPE shall be worn in accordance with the Site Specific JHA and Site Safety Plan.

Leave cultural materials in place at the site of discovery, and mark its location.

- Stop clean-up work in the vicinity surrounding the site, within a 6ft radius.
- Immediately inform the field supervisor, who in turn, should immediately inform the FOSC and/or an appropriately designated cultural resource specialist. Obtain/provide location on map by indicating latitude/longitude.

## HAZARD MITIGATION

All personnel operating in a restricted area shall wear appropriate PPE (Minimum of Tychem, face shield, neoprene gloves and rubber boots are required for workers performing pressure wash ops).

Respiratory protection may be required to be used by all personnel base on continous air montoring readings

All personnel are reminded to stay hydrated and to take breaks as needed.

Notify Assistant Safety Officer if safety issues arise.

Workers should be cautious of slick surfaces and pressurized lines that may be present during decon ops.

<p><b>PROTECTION GROUP MINIMIZATION MEASURES</b></p> <p><b>Habitat-specific Measures</b> These measures are intended to minimize impacts to all biological resources within the habitat and should be implemented to the extent possible regardless of whether listed species are present.</p> <p><b>Marine</b></p> <ul style="list-style-type: none"> <li>• Avoid entering kelp beds as much as possible.</li> <li>• Avoid boat traffic traveling near or through flocks of seabirds resting in the water.</li> <li>• Have a wildlife monitor present on all boats.</li> <li>• No spill response activities should take place within 1,000 feet of nesting seabirds.</li> <li>• If a sea otter is observed, keep all response activities as far away from the animal(s) as possible until an expert can be consulted.</li> </ul> <p><b>Riparian</b></p> <ul style="list-style-type: none"> <li>• Avoid entering wetted areas as much as possible.</li> <li>• Avoid disturbing vegetation as much as possible.</li> <li>• The number of access routes, size of staging areas, and the total area of the response should be limited to the minimum necessary to achieve the mission.</li> <li>• During the typical breeding season for riparian birds (March 1 – September 15), a biologist should survey riparian vegetation to identify, flag and avoid nests as much as possible.</li> <li>• Vegetation should be hand trimmed to remove affected portions as necessary; roots should be left in place.</li> <li>• Response activities should avoid or minimize changes in channel morphology</li> <li>• No heavy equipment (bobcats, back hoes, etc.) or earth moving in, or next to the creek shall be used without prior DFW approval.</li> <li>• Any listed plant species should be flagged and avoided.</li> <li>• For areas potentially occupied by California red-legged frogs, least Bell's vireos, southwestern willow flycatchers, see species-specific minimization measures.</li> </ul> <p><b>Sandy Beach/Dune</b></p> <ul style="list-style-type: none"> <li>• Avoid entering vegetated dune habitat as much as possible.</li> <li>• If vehicle traffic is required in the beach, travel should be restricted to the wet sand as much as possible and should avoid driving over wrack.</li> <li>• Vehicle traffic should be operated at slow enough speeds to avoid/minimize impacts to wildlife (approximately 5 to 10 miles per hour).</li> <li>• Use pre-existing access routes through dune habitat; if new access routes are necessary a biologist should be consulted on their location.</li> <li>• Manual oil removal techniques should be used as much as possible.</li> <li>• All trash or anything that would attract wildlife to the work area should be removed on a daily basis.</li> <li>• Dead oiled wildlife should be removed or buried to minimize the secondary oiling of scavenging species.</li> <li>• For areas potentially occupied by western snowy plovers and/or California least terns, see species-specific minimization measures.</li> </ul> <p><b>Estuarine</b></p> <ul style="list-style-type: none"> <li>• Avoid entering wetted habitat as much as possible.</li> <li>• Avoid disturbing vegetation as much as possible.</li> <li>• Utilize existing access routes; if new access routes are necessary a biologist should be consulted on their location.</li> <li>• A biologist should be present throughout the duration of the cleanup activities.</li> <li>• Any listed plant species should be flagged and avoided.</li> <li>• A biologist should look for nests and establish suitable buffer areas to prevent impacts</li> <li>• For areas potentially occupied by tidewater gobies or light-footed clapper rails, see species-specific minimization measures.</li> </ul> <p><b>Coastal Bluff</b></p> <ul style="list-style-type: none"> <li>• Utilize existing access routes; if new access routes are necessary a biologist should be consulted on their location.</li> <li>• Previously-disturbed areas should be used for equipment staging and vehicle parking to the maximum extent practical.</li> <li>• Any listed plant species should be flagged and avoided.</li> </ul> <p><b>Species-specific Measures</b> These measures are specifically targeted to minimize impacts to listed species during initial response, USFWS should be contacted immediately to provide incident-specific measures to best protect these species.</p> <p><b>Tidewater goby</b></p> <ul style="list-style-type: none"> <li>• Equipment and foot traffic entering wetted areas should be avoided to the maximum extent practical to prevent crushing tidewater gobies, their burrows, and eggs.</li> <li>• If supplemental water is used to flush culverts recommend gradually increasing the intensity/volume during the flush, as tidewater gobies aren't strong swimmers and could be injured or killed if there were sudden high currents. As the flow is being gradually increased, a biologist should be monitoring the culvert exit for tidewater gobies.</li> </ul>					
<b>10. Prepared By</b> Mike Nosbaum	<b>Date/Time</b> 06/06/2015 17:00	<b>11. Reviewed By (PSC)</b> A. Holton	<b>Date / Time</b> 06/06/2015 17:00	<b>12. Reviewed By (OSC)</b> Ryan Crider	<b>Date / Time</b> 06/06/2015 17:00
<b>ASSIGNMENT LIST</b>		06/06/2015 13:17		ICS 204-CG (Rev.10/07)	

- Prior to initiation of any dewatering or diversions, a qualified biologist should install 1/8 inch block nets outside the impact areas to exclude tidewater gobies. If widely separated sites are involved, more than one set of block nets should be placed to protect the work area. The nets should be installed on the first day of work and monitored thereafter for the duration of the work.
- Once the block nets are secured, qualified biologist(s) should remove all tidewater gobies found between the block nets using a 1/8 inch seine and dip nets, and relocate tidewater gobies to suitable habitat downstream of the proposed project site.
- If activities requiring block nets cannot be completed in one day, a new set or successive sets of block nets should be deployed each day, and subsequent surveys and capture/relocation performed accordingly. Fish released from one day's work should not be released into areas projected to be excavated on successive days.
- Should dewatering occur, any pumps used should be fitted with an anti-entrapment device(s) to prevent tidewater gobies from being drawn into the pump or impinged on intake screening.
- Prior to initiation of activities within occupied habitat, an informal tailgate session should be performed in order to inform response personnel about the tidewater goby avoidance/ minimization measures to be implemented during the response.

#### Least Bell's vireos and/or southwestern willow flycatchers

- Disturbance of riparian vegetation should be avoided as much as possible.
- A qualified biologist should conduct surveys within suitable habitat for least Bell's vireos and southwestern willow flycatchers during the nesting season (March 1 – September 15) prior to disturbance of riparian vegetation to identify and establish exclusion buffers around any nests (generally at least 500 feet).
- Manual equipment should be used in occupied habitat as much as possible to minimize disturbance from noise.
- If vegetation removal is required, roots should be left in place as much as possible.
- A qualified biologist should be present as much as possible during activities that impact suitable habitat.

#### California least tern and/or Western snowy plover

- All responders should be informed of the potential for western snowy plovers and/or California least terns to be impacted and of the avoidance/minimization measures being implemented.
- A qualified biologist should identify areas that may contain nests or chicks, and any entry into these areas should be avoided.
- Any work required within nesting areas should be accompanied by a qualified biologist.
- A qualified biologist should identify and demarcate access and egress routes.
- The number of vehicles and number of vehicle trips should be reduced to the minimum needed to achieve the mission.
- All activities near nests or chicks should occur on the lower beach (wet sand), if possible.
- Watch for and avoid western snowy plovers sheltering in tire tracks and sandy depressions.
- If vehicles are used, speed should be kept to less than 10 mph, and vehicles should remain on the lower beach (wet sand), if possible. If it is not possible to remain on the lower beach (e.g., it is high tide), responders should stop every 100 m and scan ahead with binoculars to look for western snowy plovers and California least terns on the beach.
- The amount of wrack, shells, and natural debris removed from the beach should be minimized. If shoreline pre-cleaning is necessary, debris should be stockpiled in an appropriate location (avoiding nesting locations) and returned to the beach after the threat of oil is gone, to the extent practical.

#### California red-legged frog

- A qualified biologist should survey the work area prior to the onset of response activities to identify California red-legged frog egg masses, tadpoles, juveniles and adults.
- All egg masses should be avoided as much as possible and should only be relocated by a qualified biologist if oiling is imminent or response activities are sure to injure or kill the eggs.
- Tadpoles, juveniles and adults that could be injured or killed by exposure to oil or response activities should be relocated by a qualified biologist to a nearby suitable habitat that would not be impacted by response activities (ideally, upstream in the same drainage, or in the same watershed).
- After California red-legged frogs have been relocated outside of the work area, exclusion fencing (silt fence or similar) can be installed to minimize frogs from re-entering the work area. Fences should be inspected daily and should not be expected to completely prevent re-entry.
- After California red-legged frogs have been relocated outside of the work area, exclusion fencing (silt fence or similar) can be installed to minimize frogs from re-entering the work area. Fences should be inspected by a qualified biologist each morning and should not be expected to completely prevent re-entry.
- Open excavations and trenches should be covered each night to prevent entrapment of frogs.
- If vegetation removal is necessary, roots should remain in place as much as possible.

instruct the team in separating the oiled animal from the regular waste stream and (ideally) collecting it in a separate plastic bag, labeled with division/assignment area, and called into the Wildlife Hotline at 877-823-6926 for Recovery personnel to arrange pick up.

For all other DEAD oiled wildlife (marine organisms) discontinue segregating these - they will not be picked up. Dispose with the rest of the oiled material being removed

Do not initiate any on-shore response or cleanup at Coal Oil Point without consulting the USFWS and California Dept of Fish and Wildlife.

Unknown source oil impacts should be reported to Lourdes Mahoney at 813-391-4657 (lmahony@cteh.com)

#### SAFETY MESSAGE

All personnel are reminded to keep hydrated and take rest breaks at a 50/10 work/rest ratio.

PPE: Tyvek suits, gloves, safety glass, neoprene boots. Avoid walking near waterways.

PFDF's must be worn if the potential for drowning exists.

All response personnel are to be cautious of moving vehicles at all times and look in all directions before proceeding. Response personnel should be aware that all railroad tracks are in active use and should show extreme caution when operating in vicinity of tracks.

Report All Injuries require a immediate notification to Direct Supervisor.

#### HISTORICAL/CULTURAL GUIDELINES

Leave cultural materials in place at the site of discovery, and mark its location.

Stop clean-up work in the vicinity surrounding the site, within a 6ft radius.

Immediately inform the field supervisor, who in turn, should immediately inform the FOSC and/or an appropriately designated cultural resource specialist. Obtain/provide location on map by indicating latitude/longitude.

In the event a scheduled meal is not made available to your crew, report this immediately to your Branch Director and Logistics Chief Brian Shive 832-341-4719

the tidewater goby avoidance/ minimization measures to be implemented during the response.

California red-legged frog

- A qualified biologist should survey the work area prior to the onset of response activities to identify California red-legged frog egg masses, tadpoles, juveniles and adults.
- All egg masses should be avoided as much as possible and should only be relocated by a qualified biologist if oiling is imminent or response activities are sure to injure or kill the eggs.
- Tadpoles, juveniles and adults that could be injured or killed by exposure to oil or response activities should be relocated by a qualified biologist to a nearby suitable habitat that would not be impacted by response activities (ideally, upstream in the same drainage, or in the same watershed).
- After California red-legged frogs have been relocated outside of the work area, exclusion fencing (silt fence or similar) can be installed to minimize frogs from re-entering the work area. Fences should be inspected daily and should not be expected to completely prevent re-entry.
- After California red-legged frogs have been relocated outside of the work area, exclusion fencing (silt fence or similar) can be installed to minimize frogs from re-entering the work area. Fences should be inspected by a qualified biologist each morning and should not be expected to completely prevent re-entry.
- Open excavations and trenches should be covered each night to prevent entrapment of frogs.
- If vegetation removal is necessary, roots should remain in place as much as possible.

Least Bell's vireos and/or southwestern willow flycatchers

- Disturbance of riparian vegetation should be avoided as much as possible.
- A qualified biologist should conduct surveys within suitable habitat for least Bell's vireos and southwestern willow flycatchers during the nesting season (March 1 – September 15) prior to disturbance of riparian vegetation to identify and establish exclusion buffers around any nests (generally at least 500 feet).
- Manual equipment should be used in occupied habitat as much as possible to minimize disturbance from noise.
- If vegetation removal is required, roots should be left in place as much as possible.
- A qualified biologist should be present as much as possible during activities that impact suitable habitat.

division/assignment area, and called into the Wildlife Hotline at 877-823-6926 for Recovery personnel to arrange pick up.

For all other DEAD oiled wildlife (marine organisms) discontinue segregating these - they will not be picked up. Dispose with the rest of the oiled material being removed

Do not initiate any on-shore response or cleanup at Coal Oil Point without consulting the USFWS and California Dept of Fish and Wildlife.

Unknown source oil impacts should be reported to Lourdes Mahoney at 813-391-4657 (lmahony@cteh.com)

#### SAFETY MESSAGE

All personnel are reminded to keep hydrated and take rest breaks at a 50/10 work/rest ratio.

PPE: Tyvek suits, gloves, safety glass, neoprene boots. Avoid walking near waterways.

PFD's must be worn if the potential for drowning exists.

All response personnel are to be cautious of moving vehicles at all times and look in all directions before proceeding. Response personnel should be aware that all railroad tracks are in active use and should show extreme caution when operating in vicinity of tracks.

Report All Injuries require a immediate notification to Direct Supervisor.

#### HISTORICAL/CULTURAL GUIDELINES

Leave cultural materials in place at the site of discovery, and mark its location.

Stop clean-up work in the vicinity surrounding the site, within a 6ft radius.

Immediately inform the field supervisor, who in turn, should immediately inform the FOSC and/or an appropriately designated cultural resource specialist. Obtain/provide location on map by indicating latitude/longitude.

In the event a scheduled meal is not made available to your crew, report this immediately to your Branch Director and Logistics Chief Brian Shive 832-341-4719

the tidewater goby avoidance/ minimization measures to be implemented during the response.

California red-legged frog

- A qualified biologist should survey the work area prior to the onset of response activities to identify California red-legged frog egg masses, tadpoles, juveniles and adults.
- All egg masses should be avoided as much as possible and should only be relocated by a qualified biologist if oiling is imminent or response activities are sure to injure or kill the eggs.
- Tadpoles, juveniles and adults that could be injured or killed by exposure to oil or response activities should be relocated by a qualified biologist to a nearby suitable habitat that would not be impacted by response activities (ideally, upstream in the same drainage, or in the same watershed).
- After California red-legged frogs have been relocated outside of the work area, exclusion fencing (silt fence or similar) can be installed to minimize frogs from re-entering the work area. Fences should be inspected daily and should not be expected to completely prevent re-entry.
- After California red-legged frogs have been relocated outside of the work area, exclusion fencing (silt fence or similar) can be installed to minimize frogs from re-entering the work area. Fences should be inspected by a qualified biologist each morning and should not be expected to completely prevent re-entry.
- Open excavations and trenches should be covered each night to prevent entrapment of frogs.
- If vegetation removal is necessary, roots should remain in place as much as possible.

the tidewater goby avoidance/ minimization measures to be implemented during the response.

California least tern and/or Western snowy plover

- All responders should be informed of the potential for western snowy plovers and/or California least terns to be impacted and of the avoidance/minimization measures being implemented.
- A qualified biologist should identify areas that may contain nests or chicks, and any entry into these areas should be avoided.
- Any work required within nesting areas should be accompanied by a qualified biologist.
- A qualified biologist should identify and demarcate access and egress routes.
- The number of vehicles and number of vehicle trips should be reduced to the minimum needed to achieve the mission.
- All activities near nests or chicks should occur on the lower beach (wet sand), if possible.
- Watch for and avoid western snowy plovers sheltering in tire tracks and sandy depressions.
- If vehicles are used, speed should be kept to less than 10 mph, and vehicles should remain on the lower beach (wet sand), if possible. If it is not possible to remain on the lower beach (e.g., it is high tide), responders should stop every 100 m and scan ahead with binoculars to look for western snowy plovers and California least terns on the beach.
- The amount of wrack, shells, and natural debris removed from the beach should be minimized. If shoreline pre-cleaning is necessary, debris should be stockpiled in an appropriate location (avoiding nesting locations) and returned to the beach after the threat of oil is gone, to the extent practical.

California red-legged frog

- A qualified biologist should survey the work area prior to the onset of response activities to identify California red-legged frog egg masses, tadpoles, juveniles and adults.
- All egg masses should be avoided as much as possible and should only be relocated by a qualified biologist if oiling is imminent or response activities are sure to injure or kill the eggs.
- Tadpoles, juveniles and adults that could be injured or killed by exposure to oil or response activities should be relocated by a qualified biologist to a nearby suitable habitat that would not be impacted by response activities (ideally, upstream in the same drainage, or in the same watershed).
- After California red-legged frogs have been relocated outside of the work area, exclusion fencing (silt fence or similar) can be installed to minimize frogs from re-entering the work area. Fences should be inspected daily and should not be expected to completely prevent re-entry.
- After California red-legged frogs have been relocated outside of the work area, exclusion fencing (silt fence or similar) can be installed to minimize frogs from re-entering the work area. Fences should be inspected by a qualified biologist each morning and should not be expected to completely prevent re-entry.
- Open excavations and trenches should be covered each night to prevent entrapment of frogs.
- If vegetation removal is necessary, roots should remain in place as much as possible.

<b>10. Prepared By</b> Mike Nosbaum	<b>Date/Time</b> 06/06/2015 17:00	<b>11. Reviewed By (PSC)</b> A. Holton	<b>Date / Time</b> 06/06/2015 17:00	<b>12. Reviewed By (OSC)</b> Ryan Crider	<b>Date / Time</b> 06/06/2015 17:00
<b>ASSIGNMENT LIST</b>		06/06/2015 13:14		ICS 204-CG (Rev.10/07)	

strong swimmers and could be injured or killed if there were sudden high currents. As the flow is being gradually increased, a biologist should be monitoring the culvert exit for tidewater gobies.

- Prior to initiation of any dewatering or diversions, a qualified biologist should install 1/8 inch block nets outside the impact areas to exclude tidewater gobies. If widely separated sites are involved, more than one set of block nets should be placed to protect the work area. The nets should be installed on the first day of work and monitored thereafter for the duration of the work.
- Once the block nets are secured, qualified biologist(s) should remove all tidewater gobies found between the block nets using a 1/8 inch seine and dip nets, and relocate tidewater gobies to suitable habitat downstream of the proposed project site.
- If activities requiring block nets cannot be completed in one day, a new set or successive sets of block nets should be deployed each day, and subsequent surveys and capture/relocation performed accordingly. Fish released from one day's work should not be released into areas projected to be excavated on successive days.
- Should dewatering occur, any pumps used should be fitted with an anti-entrapment device(s) to prevent tidewater gobies from being drawn into the pump or impinged on intake screening.
- Prior to initiation of activities within occupied habitat, an informal tailgate session should be performed in order to inform response personnel about the tidewater goby avoidance/ minimization measures to be implemented during the response.

Least Bell's vireos and/or southwestern willow flycatchers

- Disturbance of riparian vegetation should be avoided as much as possible.
- A qualified biologist should conduct surveys within suitable habitat for least Bell's vireos and southwestern willow flycatchers during the nesting season (March 1 – September 15) prior to disturbance of riparian vegetation to identify and establish exclusion buffers around any nests (generally at least 500 feet).
- Manual equipment should be used in occupied habitat as much as possible to minimize disturbance from noise.
- If vegetation removal is required, roots should be left in place as much as possible.
- A qualified biologist should be present as much as possible during activities that impact suitable habitat.

California least tern and/or Western snowy plover

- All responders should be informed of the potential for western snowy plovers and/or California least terns to be impacted and of the avoidance/minimization measures being implemented.
- A qualified biologist should identify areas that may contain nests or chicks, and any entry into these areas should be avoided.
- Any work required within nesting areas should be accompanied by a qualified biologist.
- A qualified biologist should identify and demarcate access and egress routes.
- The number of vehicles and number of vehicle trips should be reduced to the minimum needed to achieve the mission.
- All activities near nests or chicks should occur on the lower beach (wet sand), if possible.
- Watch for and avoid western snowy plovers sheltering in tire tracks and sandy depressions.
- If vehicles are used, speed should be kept to less than 10 mph, and vehicles should remain on the lower beach (wet sand), if possible. If it is not possible to remain on the lower beach (e.g., it is high tide), responders should stop every 100 m and scan ahead with binoculars to look for western snowy plovers and California least terns on the beach.
- The amount of wrack, shells, and natural debris removed from the beach should be minimized. If shoreline pre-cleaning is necessary, debris should be stockpiled in an appropriate location (avoiding nesting locations) and returned to the beach after the threat of oil is gone, to the extent practical.

California red-legged frog

- A qualified biologist should survey the work area prior to the onset of response activities to identify California red-legged frog egg masses, tadpoles, juveniles and adults.
- All egg masses should be avoided as much as possible and should only be relocated by a qualified biologist if oiling is imminent or response activities are sure to injure or kill the eggs.
- Tadpoles, juveniles and adults that could be injured or killed by exposure to oil or response activities should be relocated by a qualified biologist to a nearby suitable habitat that would not be impacted by response activities (ideally, upstream in the same drainage, or in the same watershed).
- After California red-legged frogs have been relocated outside of the work area, exclusion fencing (silt fence or similar) can be installed to minimize frogs from re-entering the work area. Fences should be inspected daily and should not be expected to completely prevent re-entry.
- After California red-legged frogs have been relocated outside of the work area, exclusion fencing (silt fence or similar) can be installed to minimize frogs from re-entering the work area. Fences should be inspected by a qualified biologist each morning and should not be expected to completely prevent re-entry.
- Open excavations and trenches should be covered each night to prevent entrapment of frogs.
- If vegetation removal is necessary, roots should remain in place as much as possible.

<b>ASSIGNMENT LIST</b>		06/06/2015 13:18	
		ICS 204-CG (Rev.10/07)	

be excavated on successive days.

- Should dewatering occur, any pumps used should be fitted with an anti-entrapment device(s) to prevent tidewater gobies from being drawn into the pump or impinged on intake screening.
- Prior to initiation of activities within occupied habitat, an informal tailgate session should be performed in order to inform response personnel about the tidewater goby avoidance/ minimization measures to be implemented during the response.

#### California red-legged frog

- A qualified biologist should survey the work area prior to the onset of response activities to identify California red-legged frog egg masses, tadpoles, juveniles and adults.
- All egg masses should be avoided as much as possible and should only be relocated by a qualified biologist if oiling is imminent or response activities are sure to injure or kill the eggs.
- Tadpoles, juveniles and adults that could be injured or killed by exposure to oil or response activities should be relocated by a qualified biologist to a nearby suitable habitat that would not be impacted by response activities (ideally, upstream in the same drainage, or in the same watershed).
- After California red-legged frogs have been relocated outside of the work area, exclusion fencing (silt fence or similar) can be installed to minimize frogs from re-entering the work area. Fences should be inspected daily and should not be expected to completely prevent re-entry.
- After California red-legged frogs have been relocated outside of the work area, exclusion fencing (silt fence or similar) can be installed to minimize frogs from re-entering the work area. Fences should be inspected by a qualified biologist each morning and should not be expected to completely prevent re-entry.
- Open excavations and trenches should be covered each night to prevent entrapment of frogs.
- If vegetation removal is necessary, roots should remain in place as much as possible.

#### Least Bell's vireos and/or southwestern willow flycatchers

- Disturbance of riparian vegetation should be avoided as much as possible.
- A qualified biologist should conduct surveys within suitable habitat for least Bell's vireos and southwestern willow flycatchers during the nesting season (March 1 – September 15) prior to disturbance of riparian vegetation to identify and establish exclusion buffers around any nests (generally at least 500 feet).
- Manual equipment should be used in occupied habitat as much as possible to minimize disturbance from noise.
- If vegetation removal is required, roots should be left in place as much as possible.
- A qualified biologist should be present as much as possible during activities that impact suitable habitat.

#### California least tern and/or Western snowy plover

- All responders should be informed of the potential for western snowy plovers and/or California least terns to be impacted and of the avoidance/minimization measures being implemented.
- A qualified biologist should identify areas that may contain nests or chicks, and any entry into these areas should be avoided.
- Any work required within nesting areas should be accompanied by a qualified biologist.
- A qualified biologist should identify and demarcate access and egress routes.
- The number of vehicles and number of vehicle trips should be reduced to the minimum needed to achieve the mission.
- All activities near nests or chicks should occur on the lower beach (wet sand), if possible.
- Watch for and avoid western snowy plovers sheltering in tire tracks and sandy depressions.
- If vehicles are used, speed should be kept to less than 10 mph, and vehicles should remain on the lower beach (wet sand), if possible. If it is not possible to remain on the lower beach (e.g., it is high tide), responders should stop every 100 m and scan ahead with binoculars to look for western snowy plovers and California least terns on the beach.
- The amount of wrack, shells, and natural debris removed from the beach should be minimized. If shoreline pre-cleaning is necessary, debris should be stockpiled in an appropriate location (avoiding nesting locations) and returned to the beach after the threat of oil is gone, to the extent practical.

<b>8. Work Assignment Special Instructions, Special Equipment/Supplies Needed for Assignment</b>					
<p><b>DIVISION E/F/G/H MINIMIZATION MEASURES</b></p> <p><b>Habitat-specific Measures</b> These measures are intended to minimize impacts to all biological resources within the habitat and should be implemented to the extent possible regardless of whether listed species are present.</p> <p><b>Riparian</b></p> <ul style="list-style-type: none"> <li>• Avoid entering wetted areas as much as possible.</li> <li>• Avoid disturbing vegetation as much as possible.</li> <li>• The number of access routes, size of staging areas, and the total area of the response should be limited to the minimum necessary to achieve the mission.</li> <li>• During the typical breeding season for riparian birds (March 1 – September 15), a biologist should survey riparian vegetation to identify, flag and avoid nests as much as possible.</li> <li>• Vegetation should be hand trimmed to remove affected portions as necessary; roots should be left in place.</li> <li>• Response activities should avoid or minimize changes in channel morphology</li> <li>• No heavy equipment (bobcats, back hoes, etc.) or earth moving in, or next to the creek shall be used without prior DFW approval.</li> <li>• Any listed plant species should be flagged and avoided.</li> <li>• For areas potentially occupied by California red-legged frogs, western pond turtle, least Bell's vireos, southwestern willow flycatchers, see species-specific minimization measures.</li> </ul> <p><b>Sandy Beach/Dune</b></p> <ul style="list-style-type: none"> <li>• Avoid entering vegetated dune habitat as much as possible.</li> <li>• If vehicle traffic is required in the beach, travel should be restricted to the wet sand as much as possible and should avoid driving over wrack.</li> <li>• Vehicle traffic should be operated at slow enough speeds to avoid/minimize impacts to wildlife (approximately 5 to 10 miles per hour).</li> <li>• Use pre-existing access routes through dune habitat; if new access routes are necessary a biologist should be consulted on their location.</li> <li>• Manual oil removal techniques should be used as much as possible.</li> <li>• All trash or anything that would attract wildlife to the work area should be removed on a daily basis.</li> <li>• Dead oiled wildlife should be removed or buried to minimize the secondary oiling of scavenging species.</li> <li>• For areas potentially occupied by western snowy plovers and/or California least terns, see species-specific minimization measures.</li> <li>• Avoid marine mammal haul-out sites for harbor seal, elephant seal and/or California sea lion (Mugu Lagoon)</li> <li>• Additional sensitive species potentially present include silvery legless lizard, California grunion, sandy beach tiger beetle, and globose dune beetle, wandering skipper, and Point Mugu dune weevil.</li> </ul> <p><b>Estuarine</b></p> <ul style="list-style-type: none"> <li>• Avoid entering wetted habitat as much as possible.</li> <li>• Avoid disturbing vegetation as much as possible.</li> <li>• Utilize existing access routes; if new access routes are necessary a biologist should be consulted on their location.</li> <li>• A biologist should be present throughout the duration of the cleanup activities.</li> <li>• Any listed plant species should be flagged and avoided, including salt marsh bird's-beak, Ventura marsh milk-vetch.</li> <li>• A biologist should look for nests and establish suitable buffer areas to prevent impacts</li> <li>• For areas potentially occupied by tidewater gobies, light-footed clapper rails, Belding's savannah sparrows, see species-specific minimization measures.</li> </ul> <p><b>Species-specific Measures</b> These measures are specifically targeted to minimize impacts to listed species during initial response, USFWS should be contacted immediately to provide incident-specific measures to best protect these species.</p> <p><b>Tidewater goby</b></p> <ul style="list-style-type: none"> <li>• Equipment and foot traffic entering wetted areas should be avoided to the maximum extent practical to prevent crushing tidewater gobies, their burrows, and eggs.</li> <li>• If supplemental water is used to flush culverts recommend gradually increasing the intensity/volume during the flush, as tidewater gobies aren't strong swimmers and could be injured or killed if there were sudden high currents. As the flow is being gradually increased, a biologist should be monitoring the culvert exit for tidewater gobies.</li> <li>• Prior to initiation of any dewatering or diversions, a qualified biologist should install 1/8 inch block nets outside the impact areas to exclude tidewater gobies. If widely separated sites are involved, more than one set of block nets should be placed to protect the work area. The nets should be installed on the first day of work and monitored thereafter for the duration of the work.</li> <li>• Once the block nets are secured, qualified biologist(s) should remove all tidewater gobies found between the block nets using a 1/8 inch seine and dip nets, and relocate tidewater gobies to suitable habitat downstream of the proposed project site.</li> <li>• If activities requiring block nets cannot be completed in one day, a new set or successive sets of block nets should be deployed each day, and subsequent surveys and capture/relocation performed accordingly. Fish released from one day's work should not be released into areas projected to</li> </ul>					
<b>10. Prepared By</b> Mike Nosbaum	<b>Date/Time</b> 06/06/2015 17:00	<b>11. Reviewed By (PSC)</b> A. Holton	<b>Date / Time</b> 06/06/2015 17:00	<b>12. Reviewed By (OSC)</b> Ryan Crider	<b>Date / Time</b> 06/06/2015 17:00
<b>ASSIGNMENT LIST</b>		06/06/2015 13:23		ICS 204-CG (Rev.10/07)	

be excavated on successive days.

- Should dewatering occur, any pumps used should be fitted with an anti-entrapment device(s) to prevent tidewater gobies from being drawn into the pump or impinged on intake screening.
- Prior to initiation of activities within occupied habitat, an informal tailgate session should be performed in order to inform response personnel about the tidewater goby avoidance/ minimization measures to be implemented during the response.

#### California least tern and/or Western snowy plover

- All responders should be informed of the potential for western snowy plovers and/or California least terns to be impacted and of the avoidance/minimization measures being implemented.
- A qualified biologist should identify areas that may contain nests or chicks, and any entry into these areas should be avoided.
- Any work required within nesting areas should be accompanied by a qualified biologist.
- A qualified biologist should identify and demarcate access and egress routes.
- The number of vehicles and number of vehicle trips should be reduced to the minimum needed to achieve the mission.
- All activities near nests or chicks should occur on the lower beach (wet sand), if possible.
- Watch for and avoid western snowy plovers sheltering in tire tracks and sandy depressions.
- If vehicles are used, speed should be kept to less than 10 mph, and vehicles should remain on the lower beach (wet sand), if possible. If it is not possible to remain on the lower beach (e.g., it is high tide), responders should stop every 100 m and scan ahead with binoculars to look for western snowy plovers and California least terns on the beach.
- The amount of wrack, shells, and natural debris removed from the beach should be minimized. If shoreline pre-cleaning is necessary, debris should be stockpiled in an appropriate location (avoiding nesting locations) and returned to the beach after the threat of oil is gone, to the extent practical.

#### California red-legged frog

- A qualified biologist should survey the work area prior to the onset of response activities to identify California red-legged frog egg masses, tadpoles, juveniles and adults.
- All egg masses should be avoided as much as possible and should only be relocated by a qualified biologist if oiling is imminent or response activities are sure to injure or kill the eggs.
- Tadpoles, juveniles and adults that could be injured or killed by exposure to oil or response activities should be relocated by a qualified biologist to a nearby suitable habitat that would not be impacted by response activities (ideally, upstream in the same drainage, or in the same watershed).
- After California red-legged frogs have been relocated outside of the work area, exclusion fencing (silt fence or similar) can be installed to minimize frogs from re-entering the work area. Fences should be inspected daily and should not be expected to completely prevent re-entry.
- After California red-legged frogs have been relocated outside of the work area, exclusion fencing (silt fence or similar) can be installed to minimize frogs from re-entering the work area. Fences should be inspected by a qualified biologist each morning and should not be expected to completely prevent re-entry.
- Open excavations and trenches should be covered each night to prevent entrapment of frogs.
- If vegetation removal is necessary, roots should remain in place as much as possible.

#### Least Bell's vireos and/or southwestern willow flycatchers

- Disturbance of riparian vegetation should be avoided as much as possible.
- A qualified biologist should conduct surveys within suitable habitat for least Bell's vireos and southwestern willow flycatchers during the nesting season (March 1 – September 15) prior to disturbance of riparian vegetation to identify and establish exclusion buffers around any nests (generally at least 500 feet).
- Manual equipment should be used in occupied habitat as much as possible to minimize disturbance from noise.
- If vegetation removal is required, roots should be left in place as much as possible.
- A qualified biologist should be present as much as possible during activities that impact suitable habitat.

<b>7. Work Assignments</b>					
Prevent unauthorized persons from entering or remaining in the spill area. Contract and identify all persons not readily identifiable. Escort any unauthorized person from the area.					
Land units- Contact any unidentified vehicle parked in the area with emphasis on highway 101 where access to the beach can be made. Remove all unauthorized persons and vehicles. Do not loiter on or around the railway.					
Water units- Contact any unidentified vessels entering or in the spill zone. Divert or exkort unauthorized vessels from the spill area					
<b>8. Special Instructions</b>					
Identify any persons or vessels that may need decontamination. Personnel are reminded to stay hydrated and work rest regimen as neccessary.					
Instructions for Dead Wildlife and Natural Resource Protection.					
Any LIVE oiled wildlife (birds, mammals, or sea turtles) observed or incidentally collected in clean up operations should be immediately called in to the Wildlife Hotline at 877-823-6926.					
Any DEAD oiled birds, mammals, or sea turtles observed as part of cleanup operations should be called in to the team's supervisor. Supervisors can instruct the team in separating the oiled animal from the regular waste stream and (ideally) collecting it in a separate plastic bag, labeled with division/assignment area, and called into the Wildlife Hotline at 877-823-6926 for Recovery personnel to arrange pick up.					
For all other DEAD oiled wildlife (marine organisms) discontinue segregating these - they will not be picked up. Dispose with the rest of the oiled material being removed.					
Unknown source oil impacts should be reported to Lourdes Mahoney at 813-391-4657 (lmahony@cteh.com)					
Do not initiate any on-shore response or cleanup at Coal Oil Point without consulting the USFWS and California Dept of Fish and Wildlife.

ASSIGNMENT LIST		06/06/2015 14:57		ICS 204-CG (Rev.10/07)	

On Water: Avoid entering kelp beds as much as possible. Avoid boat traffic traveling near or through flocks of seabirds resting on water, stay 1000 ft away from nesting seabirds. If sea otter is observed keep clear and call Mike Harris immediately. 831-212-7090

#### SAFETY MESSAGE

All response personnel are to be cautious of moving vehicles at all times and look in all directions before proceeding. Response personnel should be aware that all railroad tracks are in active use and should show extreme caution when operating in vicinity of tracks.

#### HISTORICAL/CULTURAL GUIDELINES

- Leave cultural materials in place at the site of discovery, and mark its location.
- Stop clean-up work in the vicinity surrounding the site, within a 6ft radius.
- Immediately inform the field supervisor, who in turn, should immediately inform the FOSC and/or an appropriately designated cultural resource specialist. Obtain/provide location on map by indicating latitude/longitude.

**Report All Injuries require a immediate notification to Direct Supervisor.**

In the event a scheduled meal is not made available to your crew, report this immediately to your Branch Director and Logistics Chief Brian Shive 832-341-4719

ASSIGNMENT LIST		06/06/2015 13:29		ICS 204-CG (Rev.10/07)	

Unknown source oil impacts should be reported to Lourdes Mahoney at 813-391-4657 (lmahony@cteh.com)

Do not initiate any on-shore response or cleanup at Coal Oil Point without consulting the USFWS and California Dept of Fish and Wildlife.

#### HISTORICAL/CULTURAL GUIDELINES

- Leave cultural materials in place at the site of discovery, and mark its location.
- Stop clean-up work in the vicinity surrounding the site, within a 6ft radius.
- Immediately inform the field supervisor, who in turn, should immediately inform the FOSC and/or an appropriately designated cultural resource specialist. Obtain/provide location on map by indicating latitude/longitude.

**Report All Injuries require a immediate notification to Direct Supervisor.**

<b>ASSIGNMENT LIST</b>		06/06/2015 13:29	
		ICS 204-CG (Rev.10/07)	

- Prior to initiation of any dewatering or diversions, a qualified biologist should install 1/8 inch block nets outside the impact areas to exclude tidewater gobies. If widely separated sites are involved, more than one set of block nets should be placed to protect the work area. The nets should be installed on the first day of work and monitored thereafter for the duration of the work.
- Once the block nets are secured, qualified biologist(s) should remove all tidewater gobies found between the block nets using a 1/8 inch seine and dip nets, and relocate tidewater gobies to suitable habitat downstream of the proposed project site.
- If activities requiring block nets cannot be completed in one day, a new set or successive sets of block nets should be deployed each day, and subsequent surveys and capture/relocation performed accordingly. Fish released from one day's work should not be released into areas projected to be excavated on successive days.
- Should dewatering occur, any pumps used should be fitted with an anti-entrapment device(s) to prevent tidewater gobies from being drawn into the pump or impinged on intake screening.
- Prior to initiation of activities within occupied habitat, an informal tailgate session should be performed in order to inform response personnel about the tidewater goby avoidance/ minimization measures to be implemented during the response.

#### Least Bell's vireos and/or southwestern willow flycatchers

- Disturbance of riparian vegetation should be avoided as much as possible.
- A qualified biologist should conduct surveys within suitable habitat for least Bell's vireos and southwestern willow flycatchers during the nesting season (March 1 – September 15) prior to disturbance of riparian vegetation to identify and establish exclusion buffers around any nests (generally at least 500 feet).
- Manual equipment should be used in occupied habitat as much as possible to minimize disturbance from noise.
- If vegetation removal is required, roots should be left in place as much as possible.
- A qualified biologist should be present as much as possible during activities that impact suitable habitat.

#### California least tern and/or Western snowy plover

- All responders should be informed of the potential for western snowy plovers and/or California least terns to be impacted and of the avoidance/minimization measures being implemented.
- A qualified biologist should identify areas that may contain nests or chicks, and any entry into these areas should be avoided.
- Any work required within nesting areas should be accompanied by a qualified biologist.
- A qualified biologist should identify and demarcate access and egress routes.
- The number of vehicles and number of vehicle trips should be reduced to the minimum needed to achieve the mission.
- All activities near nests or chicks should occur on the lower beach (wet sand), if possible.
- Watch for and avoid western snowy plovers sheltering in tire tracks and sandy depressions.
- If vehicles are used, speed should be kept to less than 10 mph, and vehicles should remain on the lower beach (wet sand), if possible. If it is not possible to remain on the lower beach (e.g., it is high tide), responders should stop every 100 m and scan ahead with binoculars to look for western snowy plovers and California least terns on the beach.
- The amount of wrack, shells, and natural debris removed from the beach should be minimized. If shoreline pre-cleaning is necessary, debris should be stockpiled in an appropriate location (avoiding nesting locations) and returned to the beach after the threat of oil is gone, to the extent practical.

#### California red-legged frog

- A qualified biologist should survey the work area prior to the onset of response activities to identify California red-legged frog egg masses, tadpoles, juveniles and adults.
- All egg masses should be avoided as much as possible and should only be relocated by a qualified biologist if oiling is imminent or response activities are sure to injure or kill the eggs.
- Tadpoles, juveniles and adults that could be injured or killed by exposure to oil or response activities should be relocated by a qualified biologist to a nearby suitable habitat that would not be impacted by response activities (ideally, upstream in the same drainage, or in the same watershed).
- After California red-legged frogs have been relocated outside of the work area, exclusion fencing (silt fence or similar) can be installed to minimize frogs from re-entering the work area. Fences should be inspected daily and should not be expected to completely prevent re-entry.
- After California red-legged frogs have been relocated outside of the work area, exclusion fencing (silt fence or similar) can be installed to minimize frogs from re-entering the work area. Fences should be inspected by a qualified biologist each morning and should not be expected to completely prevent re-entry.
- Open excavations and trenches should be covered each night to prevent entrapment of frogs.
- If vegetation removal is necessary, roots should remain in place as much as possible.

## SAFETY MESSAGE/PLAN (ICS 208)

1. Incident Name:  
Refugio Incident

2. Operational Period: Date From: 06/04/2015 Date To: 06/12/2015  
Time From: 06:00 Time To: 06:00

### 3. Safety Message: Potential Wet Weather

Weather changes are predicted for the next week, bringing in rain showers.

- Wet clothing can contribute to hypothermia and other problems such as skin rashes and foot fungus.
  - Ensure that you have the proper PPE and gear for the weather.
- Pathways and working surfaces may be slick during and after rain storms.
  - Pay extra attention to the possibility of slippery surfaces
- Wet pavement, it can be very slick after long dry periods.
  - Be extra cautious when driving in these conditions.
